

FORZA FANTASY LEAGUE

Scoring System Redesign — Stakeholder Briefing

Executive Summary

Topic	Summary
Problem	FPL-style scoring overweights goals/assists. Managers converge on the same elite forwards; defenders and goalkeepers feel irrelevant.
Solution	Two approaches reward each position for what it actually contributes: Approach 1 (Performance Tiering) and Hybrid 1+3 (Position-Specific Formulas).
Data	All required metrics verified present in Forza Football API across 3 recent EPL matches. Failsafe: current scoring acts as fallback if any field is missing.
Decision	Share this document, gather feedback, choose approach. Then tune thresholds and deploy to calculate-scores Edge Function.

Data Verified — API Fields Confirmed

Field	Source Endpoint	Status
goals, assists	/v2/matches/:id/player_statistics	Confirmed
minutes_played	/v2/matches/:id/player_statistics	Confirmed
yellow/red cards	/v2/matches/:id/player_statistics	Confirmed
saves (GK)	/v2/matches/:id/player_statistics	Confirmed
tackles, interceptions	/v2/matches/:id/player_statistics	Confirmed
key_passes, shots_on_target	/v2/matches/:id/player_statistics	Confirmed
big_chances_created	/v2/matches/:id/player_statistics	Confirmed
clean sheet	Derived: goals conceded = 0 + player minutes	Confirmed

Approach 1: Performance Tiering

Reward overall performance level, not just outcomes

Philosophy

Every position has core stats that are scored. After computing a base score, a tier multiplier amplifies (or slightly reduces) based on how elite that performance was. A goalkeeper with 10 saves and a clean sheet should rival a forward with 1 goal.

Base Scoring Rules

Position	Metric	Points per unit
GK	Save	+0.5 pts
	Clean Sheet	+4.0 pts
	Penalty Saved	+5.0 pts
	90 min played	+1.0 pt
DEF	Clean Sheet	+4.0 pts
	Tackle	+0.5 pts
	Interception	+0.25 pts
	90 min played	+1.0 pt
MID	Goal	+4.0 pts
	Assist	+2.0 pts
	Key Pass	+0.25 pts
	Shot on Target	+0.5 pts
FWD	Goal	+4.0 pts
	Assist	+2.0 pts
	Shot on Target	+0.25 pts
	Big Chance Created	+1.0 pt

Tier Multipliers

Tier	Multiplier	GK Criteria	DEF Criteria	MID Criteria	FWD Criteria
Elite	x1.3	5+ saves + CS	5+ tackles	2+ assists or 2+ goals	2+ goals or 3+ assists
Strong	x1.15	3-4 saves + CS	3-4 tackles	1G+1A or 2-3 SoT	1G+1A
Standard	x1.0	1-2 saves or CS	1-2 tackles	1 goal or 1 assist	1 goal
Low	x0.8	No saves, no CS	No tackles	No goals/assists	No goals

Examples

Player	Stats	Base	Tier	Final
Ederson (GK)	10 saves, CS, 90 min	10x0.5+4+1 = 10	Elite x1.3	13 pts

Player	Stats	Base	Tier	Final
Van Dijk (DEF)	CS, 5 tackles, 2 interceptions, 90 min	$4+2.5+0.5+1 = 8$	Elite x1.3	10 pts
De Bruyne (MID)	2 goals, 1 assist, 3 key passes	$8+2+0.75 = 10.75$	Elite x1.3	14 pts
Haaland (FWD)	1 goal, 4 SoT	$4+1 = 5$	Std x1.0	5 pts

Pros	Cons
Simple unified formula — easy to communicate	Tier thresholds need careful calibration
Defenders and GKs score realistically	High-volume stats can still dominate
Predictable — no surprise outcomes	All positions share same tier logic
Low implementation risk	Less positional nuance than Hybrid

Hybrid 1+3: Position-Specific Formulas

Position-tailored base formulas + performance tier multipliers

Philosophy

Each position gets its own formula reflecting real football roles. A GK formula centres on saves and clean sheets. A DEF formula centres on defensive actions. MID and FWD formulas reward creativity and goals respectively. Tier multipliers then amplify elite performances.

Position Formulas

Position	Formula	Example
GK	$(\text{Saves} \times 0.5) + (\text{CS} \times 4) + (\text{Pen Saved} \times 5) + (\text{Min} / 90)$	Alisson: 7 saves, CS, 90 min = $3.5 + 4 + 0 + 1 = 8.5$ Elite $(5+ \text{saves} + \text{CS}) \times 1.25 = 11$ pts
DEF	$(\text{CS} \times 4) + (\text{Tackles} \times 0.5) + (\text{Interceptions} \times 0.3) + (\text{Min} / 90)$	Dias: CS, 6 tackles, 2 interc, 90 min = $4 + 3 + 0.6 + 1 = 8.6$ Elite $(\text{CS} + 5+ \text{tackles}) \times 1.25 = 11$ pts
MID	$(\text{Goals} \times 4) + (\text{Assists} \times 2) + (\text{Key Passes} \times 0.25) + (\text{SoT} \times 0.5) + (\text{Min} / 90)$	Silva: 1G, 1A, 4 KP, 2 SoT, 85 min = $4 + 2 + 1 + 1 + 0.94 = 8.94$ Strong $(\text{G} + \text{A}) \times 1.15 = 10$ pts
FWD	$(\text{Goals} \times 4) + (\text{Assists} \times 2) + (\text{Big Chances} \times 1) + (\text{Shots} \times 0.25) + (\text{Min} / 90)$	Saka: 1G, 2 big chances, 4 shots, 78 min = $4 + 0 + 2 + 1 + 0.87 = 7.87$ Standard $(1\text{G}) \times 1.0 = 8$ pts

Tier Multipliers

Tier	Multiplier	GK	DEF	MID	FWD
Elite	x1.25	5+ saves + CS	CS + 5+ tackles	2+ assists or 2+ goals	2+ goals or 1G+2A
Strong	x1.15	3-4 saves + CS	CS + 3-4 tackles	1G+1A	1G+1A or 2+ big chances
Standard	x1.0	1-2 saves or CS	CS or 2+ tackles	1 goal or 1 assist	1 goal
Low	x0.85	No saves, no CS	No CS, <2 tackles	No goals/assists	No goals

Pros	Cons
Each position rewarded for its real football role	Four formulas to tune instead of one
Maximum squad diversity — all positions viable	Slightly harder to communicate to casual users
Tier thresholds are position-specific (more fair)	More calibration work per season
Recommended: best realism-to-complexity ratio	Slightly higher implementation effort

Side-by-Side Comparison

Key criteria evaluated for both approaches

Criteria	Approach 1: Tiering	Hybrid 1+3: Position-Specific
Squad Diversity	High	Very High
Realism	High	Very High
Simplicity	Moderate	Moderate
Data Reliability	Very High	Very High
Casual-Friendly	High	High
Complexity to Build	Low	Moderate
Tune per Season	Yes — tier thresholds	Yes — 4 formulas + thresholds
Risk Profile	Low	Low-Moderate
Recommendation	Good starting point	Preferred — more nuanced

Scenarios: Same Match, Both Systems

Player / Match	Stats	Approach 1	Hybrid 1+3
Haaland (FWD)	2 goals, 1 assist, 3 SoT	14 pts	13 pts
Van Dijk (DEF)	CS, 7 tackles, 3 interceptions	10 pts	11 pts
De Bruyne (MID)	1 goal, 1 assist, 4 key passes	10 pts	10 pts
Alisson (GK)	7 saves, CS, 90 min	11 pts	11 pts
Mount (MID, quiet)	0G, 0A, 2 key passes, 65 min	1 pt	1 pt
Richarlison (FWD)	0 goals, 6 SoT, 82 min	3 pts	2 pts

Next Steps

Phase	Action	Who
1. Decision	Review doc, gather stakeholder feedback, choose approach	All
2. Calibration	Finalise tier thresholds and formula weights	Product
3. Backtest	Simulate both systems on last 10 EPL rounds, compare diversity	Engineering
4. Implement	Update calculate-scores Edge Function with new scoring rules	Engineering
5. Dry-run	Score next matchday with new system, validate edge cases	Engineering
6. Communicate	Publish scoring formula to community before launch	Product
